CLEANING UP THE CLOCK	18

## Column One

Once again, the rumor machine has been working overtime with all sorts of bad news about OSI. We like to think that we have heard most of them and have also secured some pretty reliable information from those who ought to know.

Here are the facts, as we understand them:

In September, a sizeable note from OSI to the Bank of America came due;

OSI had pledged their assets to repay the note;

On August 29, the bank moved in to "protect their assets";

The first step was to stop everything to take an inventory;

Employees were laid off, but expect to be called back;

The Bank of America now controls OSI assets, but sales from inventory are continuing;

Negotiations for substantial additional venture financing, which were already under way when the bank stepped in, are continuing;

Long range plans are still being made;

Something concrete should happen (resumption of business, perhaps with a new direction, or...) by about mid-October.

So, what does all of this mean to PEEKers? Who knows? We

have seen OSI come through too many changes to write them off... yet. They may be back stronger than ever.

On the other hand, with Osborne and others going belly up recently, they may not make it. So then what?

Suppose you own an OSI computer, and the company drops out of sight? Who will fix it? Who will support it? Who will sell you parts and software?

OK, now everybody who has depended on the factory for all those things, raise your hand. Hmm, OK, you can put your hands down now, both of you. The rest of us will keep on getting our support and parts and software from the same independent sources where we have been getting them all along.

Naturally, we believe the primary source of such support and software and parts is PEEK(65), meaning you, our readers and advertisers.

If anybody doubts that, have a look at the issue you hold in your trembling hands. You will find articles and ads and listings for everything from a new (old) text editor for small machines to entire business hard-disk systems, including a new and better data base manager which runs multi-user on a hard disk machine, an azimuth calculator for amateur astronomers and a whole new DOS.

In case you were thinking maybe your business application could use the new DBMS, but would require a hard disk, have a look at the Denver Board ad -- seems we OSIers are among the first to be able to use the new removable-media hard disk units for backup.

And last but certainly far from least, we begin in this issue our software listing. You will find everything from a snake-eating game to complete systems to run banks and clothing stores -- and much more. We plan to continue these listings as long as we have items to list, so if you still haven't sent us a description of your gem, get it in the mail!

We have received requests that the "Casette Corner" feature be reinstated. We agree that this was a valuable feature, and would love to resume it. What we need is an author. All you cassette hotshots out there, get with it. Anyone who would like to share experiences with non-disk machines, consider taking over the job. It pays magnificently (at least \$10/month) and the only requirement is to send us a sample column...

Another reader wonders about a SII users' club. Who knows of one?

*al*

## TEC65 REVIEW

By: David A. Jones  
9226 N.W. 17 Street  
Coral Springs, FL 33065

### TEC65

6502 Program Exchange  
2920 West Moana, Reno NV 89509  
\$35.00 C1P W/HEXDOS 4.0  
\$45.00 C1P W/OS65D 3.2  
\$45.00 C1P/C4P W/OS65D 3.3

TECO is a text editing language by Digital Equipment Corp, the minicomputer manufacturer. Notice that I said a text editing language, not just an editor or a word processor.

You can actually write programs (called macros) in TECO that will open one or more files, edit, combine, format, extract excerpts of, or almost anything else you would want to do with a text or data file and then write the output to one or more new files. The most common application though is as an interactive text editor. As such, it is one of the most powerful editors available today. Because TECO is very versatile, it is necessarily complex and many of its features go unused even among experienced users.

TEC65 is a subset of the most frequently used commands of TECO. To quote from the 6502 Program Exchange catalog, it can:

Change the third occurrence of the word "apple" to "orange,"

Change the first seven occurrences of the word "men" to "women,"

Make the second paragraph of a text into the fourth paragraph,

Print every line that contains the word "cycle,"

Search for a string "stoXe" where "X" is a wildcard character. Thus "stoXe" would match with "stone", "store", or "stove,"

Print 40 copies of a form letter without interruption"

.....and more.

Several commands in TEC65 vary from TECO, all apparently to make life easier. Among these; A is replaced with EA, PW becomes EW, and EO serves both as the ER and EW commands. A single escape character does a -T and a line feed does an LT. Control G is equivalent to V or OTT. None of this is really objectionable, but it does slow down those of us who type mechanically. I use TECO all daily at work and have to reprogram myself when I come home. Being so used to typing on different keyboards, I wonder why I should complain about this. I did, however, change the function of the line feed to work as an escape character when the shift lock is not down. This facilitates search and replace commands when in lower case.

TEC65 is all machine code and requires 5K of memory. Implemented on a 32K system under HEXDOS 24K of text buffer is available. With a stock system no special patches or hooks are required.

Since my system is not stock, I had to make several overlays to HEXDOS and one to TEC65. My input and output routines are customized in EPROM to support my video and parallel ports modifications. Overlaying the HEXDOS input routines at \$08B3 and output routine at \$0992 with patches accomplishes this task. Changing the input/output vectors at \$0218 and \$021A is not the proper way to do this as the disk file management code is part of HEXDOS's input/output. CEGMON support is also located here as are the HEXDOS definitions of the control keys. Also, for HEXDOS users who want to disable the control C function of the repeat key, overlay NOP's on the 14 bytes starting at \$0454. This area should currently start with \$A9. Many cassette games use the repeat key as a fire control.

Another item of interest is the start address of TEC65 at \$0F00. It's not given in the documentation but is necessary to make work or backup copies.

### Use:

SAVE#3,3838;SAVE#4,3838+2048;SAVE#5,3838+4096 to put it on tracks 3, 4 and 5. It took me quite a while to glean the necessary information to this out of the HEXDOS manual.

TEC65 is called into memory via the BASIC command LOAD \$TEC65:USR(-5)4096. I have a short BASIC program that does this and also POKES in the patches to HEXDOS and sets the default parameters for text justification. This is a clean way to do it and it allows both HEXDOS and TEC65 to remain at their original version levels. A word of warning is in order here. HEXDOS BASIC programs start at \$0B00 and TEC65 starts at \$0F00 so the calling program is limited to less than 1K. Another caution: TEC65's initialization table is located at \$2008. Once initialized, the table is no longer required and it is overwritten as it lies within the text buffer. When you want to make a backup or work copy, don't enter text to see if it works before you save it to disk. I lost a lot of sleep until these 2 facts dawned on me. The initial justification parameters are also stored here. See table 1.

To save text to a file, you must have created one beforehand large enough to receive the text. Too bad we can't create one dynamically from within TEC65 that would be just the right size. Should you enter more text into the buffer than your output file will handle, all is not lost. Just put the excess into one of the Q registers and save the rest as file nr. 1. Clear the buffer and recall the excess from the Q register and save that as file nr. 2. Assuming you have file nr.1 and file nr. 2 available. Anytime you're interested in the length of the file in the buffer, you can use the commands ZL\$=\$\$ and the character count will be displayed.

All in all, - I really like TEC65. It is character rather than line oriented and you can move the cursor to any point in the text almost instantly by using the search command. You don't have to worry about reformatting when you insert or delete text in the middle of a line, and carriage returns are only necessary for paragraphing and lines that you don't want justified, columns of numbers or data for example. Screen editors are nice sometimes, I use mine for program editing, but I feel

the character editors are more efficient for document preparation. This program has been available since 1978 on other 6502 based machines and appears to be bug free. I would expect the OS65D version to be as good. In fact, when it becomes compatible with OS65D version 5.1 just released from OSIO maybe new files could be created from within the editor.

Although not originally part of TECO, a justification routine has been added to TEC65. The justification works erratically sometimes unless you reboot TEC65 and load the file anew before printing. I have informed the exchange of this anomaly and have hopes of them providing a fix. Since this is a freebie included with the package, I won't downgrade TEC65 on this point alone.

A second freebie included is a set of 10 macro commands on one disk file. Not only are they useful, but they are educational in the use of TECO commands as well.

A clearly written 22 page manual supplemented with OSI specific information is included. A very nice program at a reasonable price.

AZIMUTH READING

By: Steve McGinnis  
505 Smith Street  
Ridgway, PA 15853

I finally started feeling guilty about not supporting PEEK so I am enclosing an OSI program I wrote after reading the April, 1982 issue of Astronomy (published by AstroMedia Corp., Milwaukee, WI).

The program will give an azimuth reading (any good compass with degree markings is close) and an altitude reading (90 degrees is up!) of any object in the sky. All

```

that is needed is the right ascension (R.A.) and the declination (DEC.) of the object in question. These numbers can be found in any good astronomy handbook. Line number 422 gives the option of 1) finding the azimuth and altitude from the celestial coordinates or 2) finding the celestial coordinates from the azimuth and altitude. (Enclosed is an output for the star Arcturas, as an example.)

The only changes that have to be made to the program are as follows:

**NO. COMMENT**

240 The adjustment from local

time is entered here. Pennsylvania is four hrs. behind Universal Time (UT).

1290 Your longitude in Degrees (DGS), Minutes (MIN), and Seconds (SEC).

1590 Your latitude in Degrees (DGS), Minutes (MIN), and Seconds (SEC).

There was a recent issue of Astronomy that gave a computer version of the April, 1982 article, but I still prefer this program. Since the mathematics is well documented in the Astronomy article, I will not repeat it here.

## OSI-FORTH

OSI-FORTH 3.0 is a full implementation of the FORTH Interest Group FORTH, for disk-based OSI systems (C1, C2, C3, C4, C8) Running under OS65D3, it includes a resident text editor and 6502 assembler. Over 150 pages of documentation and a handy reference card are provided. Requires 24K (20K C1P). Eight-inch or mini disk \$79.95. Manual only, \$9.95. "OSI-FORTH Letters" software support newsletter \$4.00/year.

Other Software for  
Ohio Scientific Computers:

### VIDEO EDITOR

Video Editor is a powerful full screen editor for disk-based C2, C4, C8 systems with the polled keyboard and color video boards (b&w monitor ok). Allows full cursor-control with insertion, deletion and duplication of source for BASIC or OSI's Assembler/Editor. Unlike versions written in BASIC, this machine-code editor is co-resident with BASIC (or the Assembler), autoloading into the highest three pages of RAM upon boot. Video Editor also provides single-keystroke control of sound, screen format, color and background color. Eight-inch or mini disk: \$14.95. Specify amount of RAM.

### SOFT FRONT PANEL

Soft Front Panel is a software single-stepper, slow-stepper and debugger-emulator that permits easy development of 6502 machine code. SFP is a fantastic monitor, simultaneously displaying all registers, flags, the stack and more. Address traps, opcode traps, traps on memory content and on port and stack activity are all supported. This is for disk systems with polled keyboard and color (b&w monitor ok). Uses sound and color capabilities of OSI C2/C4/C8 systems (not for C1P). Eight-inch or mini disk \$24.95. Specify amount of RAM. Manual only, \$4.95 (May be later credited toward software purchase). Six page brochure available free upon request.

### TERMINAL CONTROL PROGRAM

OSI-TCP is a sophisticated Terminal Control Program for editing OS-65D3 files, and for uploading and downloading these files to other computers through the CPU board's serial port on OSI C2, C4, and C8 disk-based systems with polled keyboards. Thirteen editor commands allow full editing of files, including commands for sending any text out the terminal port and saving whatever text comes back. INDUTL utility included for converting between BASIC source and TCP file text. Eight-inch or mini disk \$39.95. Manual only, \$2.95.

## OS-65U SMART TERMINAL PROGRAM

## TRM65U

by: Rick Trethewey  
8 Duran Court  
Pacifica, CA 94044

As promised, this month we will address and list the machine code program TRM65U.

The next step is to create a file on an OS-65D diskette of at least 9 tracks. This time, the name doesn't matter. Serial systems will have to change the source code at lines 260 and 270 to reflect the address of their modem port, and line 390 to properly configure the ACIA. Using the OSI Assembler/Editor (or similar utility), enter the source for the machine code. Note that the origin address for this code is \$B000, so make sure that you protect high memory before assembling this program. On the OSI Assembler, enter "HAFFF" to do this. Now, assemble the code to memory. If all has gone well to this point, hit <BREAK>. Now take out the OS-65D diskette and boot up on the OS-65U diskette with the TRM65U files on it. After BEXEC\* has run its course, run DISK.

The first thing DISK asks for is the disk address for the operation. This entry must be made in decimal, but you should have that information written down from when you created the files and then ran DIR. Next, DISK asks how many bytes are to be read or written. In our case, we need to write about 6 pages of RAM, so respond with "5600", the hexadecimal value. When DISK asks for the RAM address, enter "\$B000". Lastly, DISK asks if you want to read or write. Enter "W" for "write". DISK will now do the rest for you.

Alright, you've captured the data on disk, now how do you get at it? That's where the program "PRINT" comes in. PRINT will dump the contents of a TRM65U file to either the console or printer. The file selection routine is the same one as contained in the TRM65U executive. Also, by making the appropriate POKES to 11661 and 11662 and by using "4" as the output device number, it is possible to use PRINT to transfer programs captured in text form to the indirect file in memory.

Good luck.

## REVIEW

### SYSTEMS GENERATOR VERSION 83.1

by:  
PEEK(65)  
Tom Hill

Three weeks ago I was asked by the folks here at Peek(65) to make a review of Comptrol Systems' SYSTEMS GENERATOR. Anyone who has had the opportunity to test any new software knows the feeling of apprehension when I opened the box delivered to us by Comptrol and found twelve diskettes and a manual.

As with any new software package, the first thing I did was to read the manual from cover to cover. This manual being quite thick (about an inch and a half), took about three hours to digest. It is well organized and written totally with the end user in mind. It was easy to read and appeared to be quite informative, but as we all know, if all of the software packages that we owned performed as well as the manuals claimed they would, we could probably run the entire U.S. government from our desk tops. The manual put aside, it was time to get to work.

I wondered, how long is this monster going to take to set up, and once I do manage to get it set up, will it work at all?

I must say that it was a pleasant surprise. Following the easy to understand instructions, I was able to get the system up and running in about an hour.

As the manual states, the system requires OSU V1.43 or later, so the first thing I did was to install the new OSU. This upgraded version of the operating system has plenty of enhancements over the earlier versions, and we hope to do a review of it at a later date. Using the "Install" program provided with OSU, the floppies were easily uploaded to our CD-74 hard disk. The only modification to the Systems Generator disks was to change the name of the BEXEC\* program. This was done because SYSGEN was loaded into an existing subsystem on our hard disk. An easy to read, step by step procedure for this change is listed in the manual.

If you are going to use the system on a floppy disk ma-

chine the only thing that you have to do, after making your initial backup of the master disks, is to run them. The reason that there are so many floppies, is that in order to prevent the hassles of constantly moving disks around, many of the most frequently used programs are repeated on all of the disks. For those of you who have Denver Boards in your machines, there is even a section in the manual on configuring the system for them.

The next step was to see how hard it would be to actually run the system.

SURPRISE! SURPRISE!

The main menu came up, and all of the utilities worked just fine.

The Systems Generator is a powerful data base manager designed for the end user, using end user terms. It incorporates OSI's record locking making the system fully configured for timesharing. Master files are called "MAIN STORAGE AREAS" and key files are "INDEX STORAGE AREAS". I must admit that this took some time to get use to, but for the end user these terms should be easy to understand. When designing a main storage area, the operator has the ability to define the rows and columns on the screen for inputting information, determine if the field is to contain alpha or numeric characters, and whether it is to be checked for "DATE YYMMDD", "decimal 00.00" or no checking at all. There is also a facility to conditional check the data for as many as two conditions (=,<>, <,>,<,>+) as well as checking for duplicate information in the same field.

One of the most powerful features of the system is the use of INDEX STORAGE (key files) areas. The index storage areas are designed to be used in conjunction with the main storage areas, in that, if properly used, they are continually updated. Whenever an addition or change is made to a field in the main storage area that has a corresponding index storage area, that index is also updated. The greatest advantage to this is that if the field in the main storage area is one that the user has designated as one that is to be checked for duplicates, instead of the system taking up valuable time searching the main storage area, it checks the index area. Because the

index area is continually updated, there is no need to recreate or update the index file before printing a report. All the user has to do is sort the area or index with the fast sort supplied then print his report.

From adding and editing information, the next logical procedure is to update and perform statistical information on our data. The Systems Generator will do just about anything that the user wants. It allows the operator to globally replace the information within a field, move information to another field, and perform calculations on fields of information (addition, subtraction, multiplication, division) and then store the results in yet another field. All of these functions can be done either conditionally or unconditionally. The user also has the ability to perform the above functions on multiple storage areas. The results can then be stored in one of the storage areas that the user is working with or a completely separate storage area.

The basic reports are also quite versatile. The user can generate reports on MAIN STORAGE AREAS or INDEX STORAGE AREAS. These reports can be in the form of an area dump or in indexed order and have the ability to report the main storage file record number (something that was not available on OS-DMS). The reports can be printed on screen or printer, and because the Systems Generator uses PRTMAP the user is no longer stuck with using the device 5 printer only. He now has his choice between device 3, 5, or 8. The reports can be printed in the old fashioned DMS way (ie. horizontal or vertical) or they can be printed on paper exactly the way the input screen was designed.

Think you've heard it all? The best is yet to come!!

There are three more features available with the Systems Generator that really make it shine. They are: design single or multiple storage area updates, design custom reports, and design user menus. In designing updates and reports, the user now has the opportunity not only to perform very sophisticated updates and print reports that once took laborious time and effort in trial and error to get the proper layout, he now can store all of these para-

eters. There is even a routine that allows the user to define and store the length of a form and place information virtually any place on the paper he wishes. This is extremely important and takes all of the hassle out of hardcoding a program to fill in a preprinted form. The next time the user needs this information, all he has to do is to call the reports or the updates from their respective menus and the system will act automatically, even to the point of accessing the correct main storage areas and index storage areas.

The "Design A User Menu" portion of the Systems Generator is the most impressive portion of the system. It allows the user to define his own sub menu inserting only those options that are needed for the particular data base he is working with. When this is done, he does not have to know the names of any of the storage areas that he is going to work with, all he has to do is select his menu and password and the system opens all the storage areas pertaining to that menu. It also opens all the index files and performs automatic updates, thus allowing even the most computer illiterate person to

become quickly conversant with his data base.

Now that you have read the meat of this review, you are probably saying to yourself, "sounds good for someone who is going to start a new data base, but I don't want to spend the time to convert or rekey all the information from my current OS-DMS files to the Systems Generator." Never fear, Comptrol Systems comes through again! They have provided a nice little routine for converting OS-DMS files to the System Generator files. All the user has to do is create a MAIN STORAGE area with the Systems Generator with fields the same size as the fields in the DMS files and run the "Convert an OSI-DMS file to a SYSGEN 83.1 Main Storage Area" routine and all the work is done by the machine. This may take a while, but I would much rather have the computer do the work while I relax with my coffee.

For those of you who like to do their own custom programming, the manual supplied with the SYSTEMS GENERATOR provides plenty of help. It lists all the error codes that you may encounter, complete storage area layouts, and listings of the storage area variables,

and special variables inherent in the system.

What about bugs and fixes? Comptrol Systems has sent us a couple fixes for bugs that they have discovered. One was minor and only required changing a few lines of code. The other was quite lengthy, but to show that they are more than willing to support their system, the letter that came with the changes states, "if you want, you may send us your original diskettes for the SYSTEMS GENERATOR - VERSION 83.1 and we will refresh them AT NO COST TO YOU other than postage to us." Who could ask for more.

If you are still not sure if the SYSTEMS GENERATOR is the right data base for you, then read the Comptrol Systems ad. Call them with your questions. We have found them easy to get hold of and quite helpful with all of our questions. After you have talked to them, if you are still not sure about their system, then take them up on their FREE 30 days trial. We are sure that once you have had hands on experience with the SYSTEMS GENERATOR you won't want to give it up.

**The BEST Just Got BETTER!**

## **SYSTEMS GENERATOR Version 83.1**

Comptrol Systems is pleased to announce the latest release of its SYSTEMS GENERATOR. We have reworked this powerful data base manager to be even more flexible and user-friendly than before.

Check these features against any other data base manager:

- |  |  |
|--|--|
| Totally Screen-Driven Formatting (CRTSET)        | Hard Disk Or Floppy Disk Access (one package)    |
| Forms Processing                                 | Single-User, Time-Share, Denver Boards Supported |
| Allows Up to 7 Files Open At Once                | (one package)                                    |
| AUTOMATIC KEY FILE UPDATES DURING ALL OPERATIONS | Labels of ANY DESIGN                             |
| FAST Sort Routines                               | Uses UNMODIFIED 65U                              |
| User-Defined Data Checking                       | Batch Processing                                 |
| Record Locking                                   | NO NEED TO LEARN ANY "COMMAND" CODES             |
|  | User-Defined Menus                               |

### **And MUCH MORE!**

This is a FIELD-PROVEN enhancement of our previous release — Version 82.2.

Over 50 businesses/programmers are using the SYSTEMS GENERATOR.

Isn't it time you quit "tinkering" with other "data base managers," just to get them to work as they were designed? Move Up to the most powerful data base manager available for OSI hardware.

(Requires OS-65U — Version 1.43 or later)

Manual Only (Credited Toward Purchase) .....	\$ 50.00
SYSTEMS GENERATOR — Version 83.1 .....	\$499.00
Upgrade From Version 82.2 .....	\$150.00

### **An Offer You SHOULDN'T Refuse**

Try the SYSTEMS GENERATOR for 30 days. If you don't feel it does the job for you, return it to us and we'll refund your money — IN FULL — no questions asked.

**COMPTROL SYSTEMS      8386 Needlegrass Court      Parker, CO 80134      (303) 699-0124**

**COMPUTER REPAIRS**  
C1P - C2P - C4P

Have your personal computer serviced by a qualified technician familiar with OSI hardware. We will evaluate your computer and notify you of what should be done and how much it will cost. Any repairs will be made only by your approval. Please include a description of the problem if it is intermittent. Minimum charge is \$20 whether repairs are made or not.

C1P SERIES I OWNERS: A 24/32 column video mod. is available! Go back to a 24 column display at any time with just a flick of a switch. Uses the prototype area without piggybacking any IC's. Only \$89.95 installed.

Please include \$4.50 return postage.

The Computer Shelter  
8533 Pacific Hwy SE  
Olympia, WA 98503

# High Resolution Color Graphics

Our new Color Plus board provides 256 x 192 high-resolution graphics with 15 colors. Two 8-bit resolution joystick interfaces are included. Software extensions to OS65-D BASIC provide a superset of APPLE II graphics instructions.

Color Plus connects to the standard 48-pin bus or the 16 pin bus.

Pricing:

CP-8 for C8 or C3 computers:	\$195
CP-4 for C4 computers (5V only):	\$245
CP-bare Bare board with software:	\$ 75

## Generos Operating System

Generos is a new operating system for OSI computers. Features include descriptive error messages, optimized disk usage, device independence, and:

- ASSEM — Fast disk based assembler generates relocatable code.

- DDT — Machine language debugger with single step, trace, more.
- TECO — Most powerful and widely used text editor ever.

Currently available for 48K 8-inch systems. Call or write about availability for other configurations. Cost: \$85

## Low Power Memory Board

Our popular MEM + board is ideal for:

- Partitions for multi-user systems
- 64K CP/M systems when combined with the D&N-80 CPU board
- Upgrading systems where backplane space, low power consumption, and/or low heat dissipation is required

Options include:

- OSI compatible floppy disk controller — protects against disk crashes caused by power failures
- Real time clock/calendar — Date and time with battery backup
- Centronics parallel printer interface — Supported by software that automatically patches OS65D and OS65U
- One year warranty

VISA, MasterCard, personal checks and C.O.D.s all accepted. Add \$5 per board for shipping and handling.

To order, or for more information, contact:

Fial Computer  
5221 S.W. Corbett  
Portland, Oregon 97201

(503) 227-7083

MEM + includes the following features:

- High reliability — All memory chips in machine screw sockets
- Low power consumption
- Uses 2K x 8-bit memory chips — will accept 2716-type EPROMS.
- Versatile addressing

3.2/O/8/S/P/M/1/ \$25  
Author:  
ROBERT T. KINTZ  
ROCHESTER, NY 14610  
Seller: SAME

ANOVA is a general purpose  
analysis of variance program.  
It can analyze any design with  
combination of within and be-  
tween variables, as long as  
# CELLS <32, #SCORES/S<33 and  
total factors is <10. Also,  
contains a LOAD program to  
enter data.

**DECISION MAKING**

3.2/O/8/S/P/M/1/ \$25  
Author:  
R. T. KINTZ  
ROCHESTER, NY 14610  
Seller: SAME

Decision making is a set of  
two programs to provide com-  
puter assisted decision analy-  
sis. DECMAK is based on a  
linear model of weighted mean  
ranks and provides sensitivity  
analysis options. FDM is a  
similar program based on fuzzy  
set theory. Many options in  
each.

**MULREG**  
3.2/O/8/S/P/M/1/ \$25  
Author:  
ROBERT T. KINTZ  
ROCHESTER, NY 14610  
Seller: SAME

MULREG performs multiple  
linear regression for data  
files stored on disk. Com-  
putes Regression Equation.  
Var-Covar Matrix, Coef.  
Estimates. Residual Plots.  
Residual Listing. Program  
LOAD permits loading data  
on disk.

**OPTICAL**  
3.2/O/8/S/P/M/1/ \$40  
Author:  
R. T. KINTZ  
ROCHESTER, NY 14610  
Seller: SAME

OPTCAL is an optimization  
program which solves for Y as  
a function of up to 4 input  
variables which can be ex-  
pressed as linear, squared or  
interaction terms. Ranges  
for the 4 X-vars. can be  
specified. Designed to be  
used with good multiple  
regression program.

**PRCOMP**

Rockville, Maryland 20850

# INTRODUCING OUR NEW PRODUCT LINE

The missing tools for the OS-65U system. Our products are written in 6502 native code and are compatible with 65U, single, time-share or network modes. Floppy or hard disk systems.

**Ky. ASM V1.1-ASSEMBLER** (Virtual source files, superfast, many extra features including a label table) ...\$129 (manual \$25)(50 pgs.)

**Ky. COM V1.5-COMPILER** (Configures itself to V1.2 or 1.42, dynamic variables and arrays DIM A (N), supports machine language routines at hex6000, last 2 pages in high memory accessible, debug with interpreter and compile in 2-3 minutes. Protect your valuable source routines, gain as much as 2-10 times on average programs in execution speed. Supports 'INPUT[ and 'PRINT[ on the 1.42 system. ....\$395 (manual \$25)(110 pgs.)

**Ky. DEV I-ASSEMBLER AND COMPILER TOGETHER**....\$474(manual \$40)

**KEYMASTER I V1.0**-The word processing missing link for OS-65U based systems. KEYMASTER I is screen oriented, menu driven, simple to use yet highly advanced. KEYMASTER I contains most of the best features only found in dedicated work processing systems. Ask for the features you have been looking for and the answer will most likely be "YES!" To be released in February...Introductory price \$475 (Manual \$25)

All software comes with license agreement, registration card, manual, binder, diskette holder and 8" diskette.

Manuals are available by themselves and are deductible from full purchase price of software within 60 days after purchase.

Foreign orders must be paid in U.S. dollars and drawn on a U.S. bank or international money order.

**ALLOW 2 WEEKS FOR DELIVERY AFTER RECEIPT OF CHECK OR MONEY ORDER**

OPTIMIZING OSI BASIC  
PROGRAMS - PART II

By: Dave Rich  
Courtesy of Osmosus News

The last installment included several suggestions for speeding up your programs. Some of you may have recognized the loop example as a REPEAT.. UNTIL loop, not a WHILE loop. The WHILE loop would be coded:

```
IF T>25 THEN jump around loop
FOR X=0TO-1STEP-1
.
.
.
X=(T>25):REM WHILE T<=25
NEXT
FOR-loops
```

One very basic means of speeding up programs is to carefully examine the code within FOR loops for any statements which can be placed outside of the loops. This is a technique used by all optimizing compilers and one you can use.

Check each assignment statement. If none of the variables on the right side of the statement are redefined within the loop, or in sub-routines called from within the loop, place the statement before the FOR statement. If all items on the right side of the statement are numeric or string constants, the statement can probably be placed ahead of the FOR statement.

Be sure to check program logic to make sure that the candidate statement can really be moved. Statements which reinitialize variables must remain in the loop.

STRING CONCATENATION  
(or. how to avoid  
the collector)

The garbage collector is very important to speed but is hard to explain in a few words. You are referred to articles on how Microsoft BASIC handles strings and garbage collection.

'Garbage collection' is a process used by BASIC to clean up, or compact, variable storage when it becomes cluttered with no-longer-needed strings. Every string concatenation (A\$=B\$+C\$+D\$) leaves garbage. Constant concatenation causes frequent garbage collection, the most time-consuming process in BASIC.

Programs which build destination strings from source strings, such as command par-

sers, often accomplish this by concatenating characters to the destination string one at a time. Use of pointers cuts down on the number of string concatenations and, therefore, garbage collections.

If strings to be concatenated can be placed in several variables and then concatenated in one assignment statement, this can cut down the number of garbage strings.

If you only need to test the first letter of a string, use the ASC() function and test the ASCII value, rather than something like the following:

```

INPUT "COMMAND";A$
A$=LEFT$(A$,1)
IF A$="S"THEN10235

```

Instead, use the following:

```

INPUT"COMMAND";A$:A=ASC(A$)
IF A=83 THEN 10235
VARIABLES
(or, first things first)

```

Whenever a variable is referenced, BASIC has to search from the beginning of its variable table for the entry of that variable. To speed execution, variables which are frequently referenced and FOR-loop variables should be placed at the beginning of the table.

To do this, reference these variables at the beginning of execution. For example, if X and Y are used frequently as temporaries and loop variables, the first executed line of your program could contain

```
X=0: Y=0
```

to force them into the beginning of the variable table.

I hope these suggestions are of use to you.

#### CLEANING UP THE CLOCK

By: Steven P. Hendrix  
Route 8, Box 81E  
New Braunfels, TX 78130

Having had some intermittent memory bugs on my trusty ClP, I was relieved to discover the problem during some unrelated troubleshooting on a recent project. This problem exists, as far as I know, on every ClP and probably on other models in the Challenger line. It is negligible when operating with a 1 MHz (megahertz) clock, but can be the source of persistent and elusive bugs on a

## DBI ANNOUNCES ANOTHER FIRST FOR THE OSI<sup>††</sup> MACHINE

THE SAME PEOPLE WHO BROUGHT YOU  
THE REVOLUTIONARY **DB-1** MULTIPROCESSING ENCHANCEMENT  
INTRODUCES THE

### DS-1 SCSI HOST ADAPTER

WITH  
BATTERY BACKED REAL TIME CLOCK, 100 YEAR DAY  
DATE CALENDAR AND 5K RAM

The **DS-1** allows for many new disk technologies. For example, the IOMEGA<sup>†</sup> Alpha 10, a 10 megabyte formatted removable disk, or the 5 1/4 inch Winchester.

The combination of the **DS-1** and **Alpha 10<sup>†</sup>** are a perfect upgrade for all OSI<sup>††</sup> machines using the 48 pin bus and OS-65U<sup>††</sup> Operating Systems. This combination can also be used for additional storage and backup on hard disk models.

For Further Information Contact:

† ALPHA 10<sup>†</sup> AND IOMEGA ARE TRADEMARKS OF IOMEGA CORP.  
†† OSI AND OS-65U ARE TRADEMARKS OF OHIO SCIENTIFIC, INC.

system which has been upgraded to 2 MHz. The fix is very simple, if you're willing to cut a few traces on the processor board.

The 6502 microprocessor specifications permit each output pin to drive one standard TTL (transistor-transistor logic) load plus 130 pF (picofarads). The design on the 600 board has the phase 2 clock output driving upwards of 10 other devices with no buffering. I had not noticed this in looking at the schematics, so I was very surprised when I put an oscilloscope on the phase 2 clock during troubleshooting of my project. The supposed square wave looks more like a 50% duty cycle sawtooth:

None of the various circuits driven by this signal is particularly fussy about the rise time of the clock, and it does not drive the RAMS directly. However, since the threshold level where the circuits treat a voltage as a logic "1" is somewhat variable, this can lead to inconsistent results. Of more concern in my case, however, is the fact that the clock signal as seen by the rest of the board is delayed by about 80 nS (nanoseconds). That may seem like a very small delay, but remember that we're talking about a signal that is already only high for 250 nS (2 MHz clock). If a particular memory chip is already a bit marginal at 2 MHz, this slight delay makes the difference between working and not working.

The trick, then, is to find an unused gate on the 600 board to be used as a buffer for the clock. Alas, every unused gate that I could find inverts the output signal with respect to the input signal. Aha!! U21 already inverts the signal for some uses, so by a little rearranging, we can use an inverting buffer. While there

are several unused gates on the board, I chose to use the section of U18 on pins 8 & 9. This produces an inverted clock signal for use in the applications presently driven by U21 pin 4, and the now unneeded section of U21 can re-invert the signal for use by the circuits which were driven directly by the processor. This does introduce a slight lag of its own into the clock signal. Each 74LS04 has a typical delay of 9 nS, so the new clock signal lags the true clock by 18 nS.

This still beats the irregular 80 nS lag, however.

All right, time to get serious. Get out your soldering iron, wire cutters, etc. Remove the case, if any, and the 610 board if you have one. You'll need access to both sides of the board. Fortunately, none of the traces involved go underneath the integrated circuits, however. On the top side of the 600 board (component side), cut the trace going to pin 39 of U8 (the 6502) and the traces going to pins 3 & 4 of U21. Turn the board over and you will find another trace tied to each of pins 3 & 4 of U21. Cut these also. In each case, cut the traces close to the

A New Standard of Excellence

# FINANCIAL PLANNER

Get "What If" answers for up to 10 displayed problems in:

- Loan/Annuity Analysis
- Annuity 'Due' Analysis
- Present/Future Value Analysis
- Sinking Fund Analysis
- Amortization Schedules
- Interest Conversions

HARDWARE REQUIREMENTS: 48K OSI, dual 8" floppy, serial terminal system.

FEATURES: package allows configuration to almost all non-ANSI terminals, AND user specification of printer port.

PRICE: \$400.00 (User Manual, \$25.00, credited toward Planner purchase). Michigan residents add 4% sales tax.

COMING SOON: Ultimate Time Scheduler

DEALERS: This program, of great value to lawyers, bankers, insurance people, and real estate people, will help you sell hardware! Inquiries invited.

## A POWERFUL TOOL FOR EVALUATING ALTERNATIVES!

The first four programs all: allow you to solve a named variable after changing another variable, let you net the difference between any displayed problems, provide selective saves to disk, give you very informative printouts based on the problems solved, and much, much more.

The "Amortization Schedules" program provides more flexibility than any other schedule known to GANDER. It lets you deal with balloon payments, early pay-offs, annual payment increases (by percentages or dollars), keeps a running total of your entire transaction to pay off, schedules payments by both month and year, and reports YTD totals based on user selected calendar or fiscal years.

"Interest Conversions" lets you key in any nominal rate and reports the true effective rate for compounding semi-annually, quarterly, monthly, daily, and continuously, and allows the print out of interest tables (your choice of rate and increments). It also includes a simple calculator, which can be used without disturbing other problems displayed, and which contains three separate user addressable memories.

Finally, to aid planning, the Menu program will generate a calendar for any month/year between 1901 and 2399, and accurately accounts for leap years!

GANDER SOFTWARE

 "The Ponds"  
 Hastings, MI 49058

"It Flies"

pins so that you don't miss a branch which would stay connected.

To add the new connections, I prefer #30 insulated wire-wrap wire soldered to the appropriate points. You may find a slightly larger size such as #22 easier to work with. Tie pin 39 of U8 to pin 9 of U18, and pin 8 of U18 to pin 3 of U21. You now have the phase 2 clock available at pins 3 (inverted) and 4 (non-inverted) of U21. Tie pin 3 of U21 to the two traces which you cut loose from pin 4, and pin 4 of U21 to the two traces which you cut loose from pin 3. This completes the patch.

If you previously found that your system would not work or was unreliable at 2 MHz, test it again after making this patch. You may also find that some memory chips which were marginal at the faster speed are now quite solid. In my case, several troublesome chips suddenly decided to behave. If you have an oscilloscope available, it will be instructive to look at the clock signal on the expansion connector before and after the modification. Maybe it will even help you resist the temptation to cut corners on buffering in your next project!

**READER PROFILE**

**ED:**

In the June 1983 issue of PEEK(65) you asked readers to let you know what kind of hardware and software they had and what they were using their systems for. Here it is the middle of August, and I am just getting around to responding to your request. I trust this information is not too late for you to use.

**Hardware**  
C2-OEM (48K)  
ADDS-25 terminal  
Okidata Microline 92 printer

**Software**  
OS65U versions 1.2 and 1.43  
OS-DMS (1979 level)  
WP-3.2 Word Processor

The system is used almost exclusively in support of organizations and activities in which my wife, our four children and I are involved. All members of the family use the word processor. It has been a life-saver in meeting tight schedules for high school term papers, book reports, etc. It has also been used by my wife to prepare the minutes of

meetings for organizations of which she has been secretary. I could go on and on about the uses which we have put the word processor.

The primary applications for which our home computer system is used are competitive swimming and fund raising for our high school band parents' organization. Preparing for a swim meet entails a large amount of clerical and manual work. The larger the meet, the greater the amount of work and the challenges for the meet director. We have used our computer for everything from keeping track of entries, to producing lane cards, to generating heat sheets, to assisting with the preparation of awards. Again, I could go on and on about the automated assists we have added to swim meet management. My wife says that the use of the computer has made her job as meet director simpler by freeing her from most of the clerical and manual work (actually saving hundreds of hours each year), and permitting her to devote more attention to people-related matters.

The largest application run on the system is used to support the semi-annual citrus fruit sales which our high school band parents' organization conducts to raise money. Two years ago the position of "Data Processing Chairman" was established after I suggested to the Board of Directors that it might be feasible to use a home computer system in conjunction with the fruit sale.

In five years my last child will graduate from high school, which means I still have five years to serve as Data Processing Chairman.

To give you some idea of the size of the application, the software is contained on three eight-inch diskettes, the master files require two diskettes. The system is used for such things as order entry, sales reporting, sales contest reporting, customer follow up and printing receipts for customers to use for income tax reporting. It is a system which seems to keep on growing. There is always a new feature or function being added. This is a system which has saved people hundreds of hours in clerical time during the past two years. The organization it has brought to conducting our fund raising events has resulted in our receiving many compliments from customers as to the effi-

ciency with which our sales are done. We honestly believe that the manner in which the computer has been employed has actually accounted for higher sales and profits than would have been possible without it. If everything goes according to plan, I will be making this application system available to OSI users in the second quarter of 1984.

We have had our home computer system for three years now. We believe it to be one of the best investments we have ever made.

David A. Weigle  
Morton, IL 61550

**ED:**

So you want us to embarrass ourselves by describing the various ways we write bad BASIC in our efforts to come up with good programs? Okay.

**Machines:**  
Superboard II/ClP (16K)  
Sylvania 12" portable b/w TV for monitor  
IBM Selectric, a.k.a. COPE 1030 Terminal  
Portable Cassette Recorder

**Operating System:**  
OS65V version 3.2 as modified by Progressive Computing (64 ch. video & edit functions)  
BASIC-IN-ROM (microsoft original)

**Use:**  
Business (invoice & letters), games

I daresay many of us have tried the Polish or Aggie

(Texas A & M) method:

- 1) turn on computer;
- 2) enter first line number followed by a space;
- 3) try to figure out what comes next.

Now let me share with you a more enlightened approach. I learned this method from no less prestigious an institution than IBM. At the time (1974) I was employed as an accountant by a firm that was about to acquire its first computer - and IBM system 3 (a honey!). So the company sent me to a one-week introductory course at one of IBM's schools. Here's what I remember of that course:

Step 1. Define the output. What data do you want, where, and how should it appear?

Step 2. Examine the input. How and when will it appear? Is it sufficient for the task?

Step 3. Develop the operations necessary to get from input to output.

This is not to say I always follow this method. Often times I start with the operations phase. I'll work through the steps which (I hope) will lead me to the desired output. Along the way, I see what kind of input is required. This technique is most useful when you're not sure of the exact form of the output. Lastly, I put in the "bells and whistles" - menu or user instructions. The only documentation I use is a hard copy of the finished program.

My brother is a programmer for a well known wine company in California. The programming technique he described to me sounds like one of the best. After his boss tells him the objectives of the program, my brother goes into his office and shuts the door. For the next several hours, he sits with his feet upon his desk and thinks of all the wrong ways to write the program. Then he sits up and writes the correct program.

## LETTERS

ED:

In the March 1983 issue of Byte, on pages 389 thru 415 is a good solid public domain CBASIC program, which I chose to pump in and use. The article "Keywords in a Fuzzy

Context" by Thomas A. Smith of Camarillo, CA., accompanies 8 related programs which make up a data base for bibliographic search along the lines of so called "Fuzzy Theory", developed by Ronald Yager (see: "A Logical On-Line Bibliographic Searcher: An Application of Fuzzy Sets" IEEE Transactions on Systems, Man and Cybernetics, vol. SMC-10, no. 1, Jan. 1980, p. 51).

As the article explains, an item either belongs or doesn't belong. What the "Fuzzy theory" does is define the degree of belonging. For example, suppose I were posting to this data base a paper or article about OSI DMS software. Via assignment of keywords, I could say for instance that on a scale of 1 to 10 (or 0.0 to 1.0 as is programmed), I would rate the degree of belonging as 1.0 for OSI BUSS; 0.9 for DATA BASE; 0.7 FOR OS65U; 0.2 for TREE STRUCTURE. Now let's suppose that some time later, (after a couple of hundred articles were listed in the data base), I needed all the information I could find on Tree-Structured Data bases - then I would merely insert the various pertinent keywords with their selection rating in the 'sense of belonging' to the research project I am doing, and a listing of only those articles would appear on the list device. That's the principle of 'fuzzy theory'.

After reading the aforementioned article in BYTE, that idea looked mighty good to me, so the next thing was to punch in the program. I have CBASIC 2.06 compiler but I had never used it. I found it to be simplicity itself. Using my OSI C3, I loaded CP/M v2.24a onto a disk with the following two CBASIC 2.06 system utilities on it, viz. CBAS2 and CRUN2 (total 17K). Then I loaded also the ED program. After that, I invoked ED (actually ED FILENAM.BAS) and after receiving the ED prompt (\*), I typed 'I' for insert. That's akin to typing NEW under OSU. Then I got the words 'NEW FILE' which means that the name of the file, FILENAM.BAS is placed in the directory. The next prompt is l: (meaning program line 1) and you type in your program, being very careful to indent in the proper places for LOOPS, FN-FEND and WHILE WENDs. When you make an error, you can go back by typing control Z (gets you back into ED without clearing RAM) and doing whatever is necessary

according to standard ED conventions. 'I' gets you back into the programming mode. When you are all done, you can look the program over by typing B#T which lists the whole program out. If that's OK so far, you type 'E' - that does two things, it EXITS you out of ED and it SAVES FILENAM.BAS. Finally, you must compile the program. You do that by typing CBAS2 FILENAM (no extension) and if you did a Control P first, it will do so on the printer. It will print errors under the line where they occur with the position (column) number where the error occurred so debugging is not all too complicated. To debug, you go back to ED FILENAM.BAS (the previously saved program then becomes FILENAM.BAK) which you should erase (ERA \*.BAK) after all is well and done to conserve disk space. After you are reasonably sure that you've debugged successfully, you again compile (do that as often as is necessary until the words 'NO ERRORS DETECTED' appear under the program (the following information also prints out: Constant Area, Code Size, Data Stmt Area, and, Variable Area). You are now ready to run the program using the command CRUN2 FILENAM (no extension). From the above, you realize that the only way to change the compiled programs is via the ED program and the programs with .BAS extension, so you keep a disk (plus backup) of that disk. On the disk where you actually use the programs, it is not necessary to keep those files. Just keep the compiled versions with the .INT extensions.

The purpose of this short review is to acquaint you with entering programs using C-BASIC-2 under OSI CP/M. C-BASIC is at first complicated but if you are proficient with OSI's (Microsoft) Basic, C-BASIC will soon fall into place. I think it's a great and very powerful language to use! By all means buy the following two Osborne-McGraw-Hill books: "Osborne CP/M User Guide" by Thom Hogan, and "CBASIC User Guide" by Adam Osborne, Gordon Eubanks, Jr., and Martin McNiff. These two books have become my 'bible' in using CP/M and CBASIC respectively and were the best investments I have made.

ED:

I have just purchased a new DOS called DOS/65 which is a CP/M type system for the 6502 cpu. DOS/65 provides the same kind of file compatibility between 6502 based computers as CP/M does for Z80/8080/8086/8088 based systems.

It follows very closely the CP/M structure, in fact, anyone using a CP/M manual or guide can apply most every command to DOS/65. DOS/65 will allow reading/writing of standard CP/M files also. It is made available for most 6502 based machines and could become a great DOS if we can get enough people interested in it. Its basic is Basic/E which is very much like Micro-Soft's basic.

I own an OSI C4PMF system running now with DOS/65 and it's great. I would like to ask your 6502 system members if anyone has DOS/65 and also if anyone has available any Basic/E software? There are four of us in the Detroit OSI SIG running DOS/65 and would like very much to see this DOS promoted in order to open the door to compatible software.

Don Emmons  
Novi, MI 48050

\*\*\*\*\*

Don:

DOS/65 is currently under negotiations for a review. With a little luck it will be ready for the next issue. In the meantime, let's hear from your friends.

Peek Staff

\*\*\*\*\*

ED:

I recently purchased a used OSI C24P MF. To my amazement I then discovered that OSI doesn't make a personal computer anymore and I have been unable to find compatible software for it.

I am particularly interested in a "Wall Street Analyser" or software that would help me analyse stock options. Do you have any software that might suffice, or could you direct me to someone who might?

I have had no computer background and find the OS65D V3.0 manual very "unfriendly". I do have OS65D V3.2 software and a 1980 manual for OS65D V3.3, but no software! I am

up a stump so to speak.

Charles Huff  
Staples, MN 56479

Charles:

We don't know of such a package ready to go, but something like Technical Products' Terminal Control Program (see ad this issue) to give you access to Dow Jones through The Source and others and OSI's Planner Plus will allow you to build whatever algorithms you wish or need.

Al.

\*\*\*\*\*

ED:

I would like to hear from someone who has, or can copy the schematic from Electronic Systems Modem Kit #109A. It originally sold for \$29.95. The company was based in San Jose, CA and is now out of business.

CALENDAR ITEM

FIFTH ANNUAL NORTHEAST  
COMPUTER SHOW AND  
SOFTWARE EXPOSITION

The Fifth Annual Northeast Computer Show and Software Exposition will be held Thursday - Saturday, November 17 - 19, 1983, at Boston's Hynes Auditorium. The Show Hours are 10:30 AM to 5:30 PM daily. This is the largest annual end-user computer event in the East and features nearly 500 displays and exhibits of microcomputers, accessories, peripherals, and software. Admission is \$7.00 for adults. For more information call or write Northeast Expositions, 822 Boylston Street, Chestnut Hill, MA 02167. Telephone: 800-841-7000 or 617-739-2000 (within Massachusetts).
